

iWALKFree FACT SHEET

What is iWALKFree?

iWALKFree is a new mobility aid which replaces conventional crutches. If you have an injury to your lower leg, iWALKFree can help you maintain your independence while you recover.

How does it work?

iWALKFree attaches comfortably to the thigh of your injured leg, providing a secure point of contact with the ground and enabling you to walk much as you would normally. The iWALKFree's strong metal chassis takes your weight, while the padded knee support helps you tuck your injured leg neatly behind you, out of harm's way. [More details here](#)

What are the advantages?

iWALKFree gives you two free hands and two good legs—or nearly so. Many users, even those with active jobs, find that they can work throughout the recovery process. And, because iWALKFree encourages you to use both legs, your muscles will stay in better shape. You'll likely get back to full mobility sooner than you would on crutches.

Who's it for?

Most iWALKFree users are recovering from injuries to their feet or ankles. (We publish a full list of supported injury types [here](#).) The device can also be useful for those learning to use prosthetic limbs. iWALKFree is fully adjustable and can be adapted to suit the needs of most users. The basic requirements are that you were moderately active before your injury, that your height is 152--198cm / 5'--6'6", and that you weigh less than 125kg / 20st. [More details here](#)

Who's it NOT for?

Sorry, but iWALKFree isn't for everyone. It's definitely not a good choice if you're elderly and frail, have poor balance, or are unable to kneel comfortably. If you have weak knees, or an amputation much above the ankle, iWALKFree may not be ideal. Feel free to get in touch if you want to discuss your case in more detail. [Contact us here](#)

How difficult is it to use?

We strongly recommend that you get your iWALKFree set up by a physiotherapist. After that, you can put it on for yourself in seconds. Learning to walk with iWALKFree is a knack. Some of our customers pick it up in seconds, while others take a few hours' practice. But everyone gets it in the end!

What do the medics say?

iWALKFree originated in Canada, where medical take-up has been enthusiastic, to say the least. The device has also been embraced by various landmine charities worldwide. It is very new to the UK market—in fact, we're the first importer! If your doctor hasn't heard of iWALKFree, please show them this article and encourage them to visit our pages for healthcare pros.

What people say?

*"I walked in the 2 mile walk during part of the Parkersburg, WV Half Marathon event this weekend. You should have seen the looks on the faces of people in the crowd. I didn't get to see it, but people said they saw it on the 11 pm new last night. I was dead last and got smoked by an 86 year old on a cane. However, I was the first man across on one leg. I can't believe how easy this thing is to use and how big a secret it is. No one in the town... has ever even heard of IWALKFree." ... **Dave Sanders***

*"What a great invention! It makes life better to include golf in my life, even though I can put zero weight on my leg. If not for the iWALKFree, I would have been unable to get my hole in one. My scores are not much higher either, this round I shot a 79 and my regular handicap before the accident was a 6." ... **Joe Truckey** [More testimonials here](#)*

How do I get hold of one?

We're the sole UK importer. You can either buy an iWALKFree from us at £299, or hire it for £25/week during your recovery. Our contact details are below.
